## **Manifesto**

To be able to explain something means you understand it. The development of new ideas and search for solutions works more fluidly when it is stimulated by the free exchange of views and opinions.

Discussion is a fundamental part of the scientific process, which can include polarising opinions. A devil's advocate can help to find flaws in theories and correct them.

It is strange that the scientific debate receives so little space in printed media. Many journals only present work that fits into pre-defined opinions and that inhibits any discussion between these opinions.

*Think Loud* was created as place for scientific discussion, making, at the same time, scientific discussion open and comprehensible for everyone.
